Period

H4 + H1 + M15 means that the scanner detected that the price is over the kumo in 4 hour timeframe, 1 hour timeframe and that the price is :

- either getting over the kumo in 15 minute timeframe (previous candle crosses the kumo while up)
- or being over the kumo in 15 minute timeframe (previous candle is completely over the kumo)

H1 + M15 means that the scanner detected that the price is over the kumo in 1 hour timeframe and that the price is :

- either getting over the kumo in 15 minute timeframe (previous candle crosses the kumo while up)
- or being over the kumo in 15 minute timeframe (previous candle is completely over the kumo)

M15 means that the price is :

- either getting over the kumo in 15 minute timeframe (previous candle crosses the kumo while up)
- or being over the kumo in 15 minute timeframe (previous candle is completely over the kumo)

Validations conditions

$SSA(M15(-1)) > SSB(M15(-1))$

SSA is over SSB at previous candlestick

$JCS(M15(OPEN(0))) > KUMO(M15(0))$

Current M15 candlestick is over M15 Kumo

$JCS(M15(OPEN(0))) > KIJUN(M15(0))$

Opening price of actual M15 candlestick is over m15 Kijun at actual candlestick

$JCS(M15(OPEN(0))) > TENKAN(M15(0))$

Opening price of actual M15 candlestick is over M15 Tenkan at actual candlestick

$CHIKOU(M15(-26)) > KUMO(M15(-26))$

Chikou span at 26th previous candlestick is over M15 Kumo at 26th previous candlestick

$CHIKOU(M15(-26)) > KIJUN(M15(-26))$

Chikou span at 26th previous candlestick is over M15 Kijun at 26th previous candlestick

$CHIKOU(M15(-26)) > TENKAN(M15(-26))$

Chikou span at 26th previous candlestick is over M15 Tenkan at 26th previous candlestick

CHIKOU(M15(-26)) > HIGH(M15(-26))

Chikou span at 26th previous candlestick is over M15 Higher price at 26th previous candlestick

If a condition is true then it adds one point to the total scoring. A scoring of 8/8 means that all conditions listed above are true at the time of the detection.

Symbol column

In the Symbol column there is the current buy and sell prices. The delta value is a calculation between the current sell price and the buy price at the time of the detection (that is in the Timestamp column).

The scanner uses the broker's information, that may change.

The delta calculation uses data from FXCM web site.

The delta is shown in green when it is in « profit » and in orange when not.

The delta is just indicative, but remember that :

DELTA = Sell price of FXCM in realtime - Buy price of calculation server broker at detection time.

Is is just an idea of the trend that has occurred after the detection.

The scanner working from 4 hour timeframe to 15 minute timeframe. After some amount of time the delta value is no significative anymore. It is interesting for checking if a trend has effectively been uptrend after a detection that happened some minutes or hours ago only.
